

EVOLVED BINARY

Engineer ~ TypeScript

Evolved Binary is looking for an Engineer to join our team. At the moment we are a small remote-first company, but we are growing and have big ambitions! We are a company with a position where you can make a significant impact. As one of the earliest team members you will need to be both an excellent software engineer, and a highly motivated individual who is capable of assuming responsibility.

✨ What we do

Evolved Binary helps companies with their information storage and retrieval needs. Our flagship product is FusionDB, a new multi-model NoSQL database which we are actively developing. As well as building the tools to manage data, we also love to help organisations better understand and work with their information. Our clients include well known Publishers, Archives, and Social Media networks.

🚀 What you'll do here

- You will be a major force in advancing both Fusion Studio (our IDE and Management Tool) for FusionDB, and Petal (our Web-based Documentation Editor). You will be adding and suggesting new features, fixing issues, and responding to customer requests.
- Take ownership of your role by understanding the product and building what is needed.
- Building and managing the delivery of major features, including - Server Health Dashboards, Query Monitoring and Profiling, Web-based Server Configuration, Visual Debugging of Queries, and VCS integrated Document Editing.
- Engage with and contribute to the existing technical communities from which we have sprung, and help build a new community around FusionDB.
- Become an active member of various Open Source projects.
- Grow with us, eventually providing mentorship and technical direction to junior team members.

🔍 What we are looking for and why

- An outstanding engineer with experience of ensuring cross-platform browser compatibility.

Our software is expected to run on all modern Web-browsers and mobile platforms.

- An engineer whose primary languages are TypeScript/JavaScript, HTML, and CSS.

Fusion Studio is developed in TypeScript using the Theia framework. Petal is developed in TypeScript, HTML5, CSS3, and makes use of the ProseMirror Open Source editor.

- Willingness to Learn New Skills.

We want you to also become a capable back-end developer. Thus ensuring that you have a holistic view of our products. Like most modern developers we are also polyglot, our backends are developed in Java and C++. To a lesser extent we also make use of Rust, XQuery, and Scala.

- An engineer who can quickly get to grips with a foreign code-base.

We often need to add features or solve bugs in 3rd-party Open Source components.

- Familiarity with working in Open Source communities.

When we improve Open Source code, we always try and give back for the benefit of everyone else. You should be comfortable with performing Git rebase from the terminal, juggling multiple source branches, and iterating through code-reviews (e.g. via GitHub Pull Requests).

Our values

We value:

- People and Equal Opportunities, we believe in continuous self-improvement, and most importantly we want to build a happy and lasting team.
- Challenges, we expect our team to challenge each other when deciding on the best solution.
- Community Engagement, and would help you to attend relevant conferences, meetups, and events.
- Research, and would help you in producing papers for publication.
- Open Source, we use a large amount of Open Source components and contribute back to many projects.
- The Right Approach, we rarely prioritise the quick or easy approach.

You will love this job if you...

- are Passionate.

This is a job for someone who wants to deliver the best solution.

- are Highly Self-Motivated.

We are a small company, and so we require inspired team members.

- want to Have a Voice.

You can influence the product and be listened to.

- want others to See Your Work.

We attend conferences, engage with communities, and much of our (and potentially your) work is Open Source or performed in the open.

- enjoy Solving Difficult Problems.

Database engines touch on many parts of computer science, and in our opinion offer some of the most interesting technical challenges.

Bonus points!

- FusionDB, Fusion Studio, and Petal are multi-platform (Linux/Mac/Windows), all applicants should be comfortable working in a Linux or Mac environment by default. Experience of building/packaging products on Windows is considered a bonus.
- FusionDB is multi-model, its first model is an XML document store. Knowledge of XQuery and/or XSLT would be a bonus. Sure, every developer knows a bit of XML and XPath, but perhaps you can show us more?
- Any prior experience of developing web-based editors, IDEs, or management tools would be an advantage.
- Open Source chops. If you have made significant contributions to one or more Open Source projects, then let us know!

What you get

- To be one of our first employees.
- Remote-first position.
- Competitive market salary (employee) or rate (contractor).
- Benefits appropriate to your country of residence, e.g. health insurance/pension/etc.
- Home Office equipment / Local Co-Work membership as needed.
